III. CHECK

In this phase, you will evaluate the results gathered from your survey.

Assess whether the implementation you completed in the DO phase was able to improve or meet the project goals stated in your PLAN phase. There is no need to include raw data in this section; instead, provide a summary of your survey results.

Focus on analyzing how these results relate to the goals or objectives you wrote in the PLAN phase. Since the purpose of this phase is to check or evaluate the implementation done in the DO phase, you will review the feedback from your users and determine whether your system met their needs and expectations.

You may also include graphs or figures to support your analysis.

IV. ACT

In this phase, you will identify and **describe the changes or improvements** you need to implement in your system based on the findings from the CHECK phase. The **ACT phase focuses on what you will do next to address any gaps, issues, or new insights discovered during evaluation.**

Your output in this section should include:

- A list of improvements or corrective actions you need to make.
- A short explanation of why each improvement is necessary, directly linked to your survey results.
- Whether the improvement is related to your original project goals (from the PLAN phase) or is an additional enhancement discovered through user feedback.

Examples:

- If your UI/UX improved but users said the button placement was confusing, then in the ACT phase you will state that you need to revise the button placement.
- If your CHECK results showed issues outside your original objectives—such as weak system security—you should still mention that you will focus on improving system security as part of your ACT phase.
